----------------------------	-----

(A) . **Grease nipple** for supplying lubricating grease.

(B) . **Grease hole** ..... Grease groove on outside of the outer race together with two grease holes provides efficient flow of grease to ball and raceways.

(C) . **Hollow set screw** ..... Two hollow set screws ensure easy and firm mounting on a shaft.

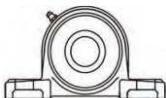

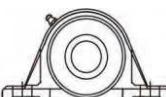

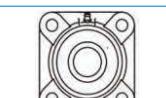

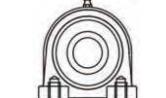

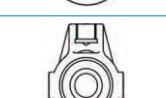

(D) . **One piece cast iron housing** ..... of rigid structure and fault-free.

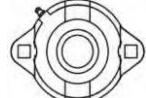

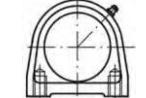

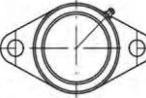

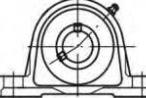

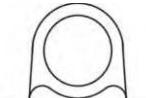

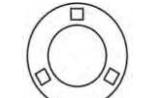

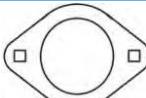

(E) . **Steel plate slinger** ..... Perfect sealing with steel slingers and synthetic rubber seals excludes dust efficiently. Centrifugal force generated by shaft rotation also prevents the grease from leaking out of bearing.

(F) . **Synthetic rubber seals** ..... Synthetic rubber seals placed between the inner ring and the outer ring prevent lubricating grease from leaking as well as preventing moisture and dust from entry.

(G) . **Self-aligning surface** ..... Self-aligning in any direction enable misaligned shaft to be centered.

**Ball Bearing Units (Types)**

	<p><b>1. Pillow Blocks</b>  Pillow blocks have various series, can make up different bearing unit with various types of insert ball bearing.  It is one of the most widely used bearing unit.</p>	UCP2, NAP2, UKP2+H, SBP2G, SAP2G UCP2M, NAP2M, UKP2M+H UCK2, NAPK2 UCPX, SALP2G, SBLP2G UCP3, NAP3, UKP3+H
	<p><b>2. Pillow blocks (High Center Height)</b>  This is a kind of pillow block that is heightening the center height.</p>	UCPH2, NAPH2, UKPH2+H
	<p><b>3. Tapped-base Pillow blocks</b>  This structure is very compact, the setscrew hole is at the bottom, which reduces the installation space. As Market demand is different, the series are: PA200 PA200A. PG200.</p>	UCPA2, NAPA2, UKPA2+H UCPA2A UCPG2
	<p><b>4. Flange Units (Square)</b>  This bearing units are widely used in the mechanical equipment .with four installation bolt holes,relatively stable. It can make up different bearing unit with various types of insert ball bearing.  Size series: F200,F300,FX300,FXOO,FU200.  Flange Unit (Square) UCFS3,NAFS3,UKFS3+H.  Its (bottom surface has a circular convex platform,which matches with the mechanical stop, and it's used in the occasion where the central position is demanded to be higher.</p>	UCF2, NAF2, NAFU2, UKF2+H, SAF2G UCFX, SBF2G UCF3, NAF3, UKF3+H
	<p><b>5. Flange Cartridge Units</b>  With assembly flange at the bottom,can be installed on the jamb wall of host. It is used in the case of high requirement on the center position of shaft.</p>	UCFC2, NAFC2, UKFC2+H
	<p><b>6. Flange Units (Oval)</b>  This housing has two installation holes, small space required, easy installation, widely used.  Size series: FL200,FL300,FLU200,FLXOO.</p>	UCFL2,NAFL2,NAFLU2 UKFL2+H, SBFL2G UCFL3, NAFL3, UKFL3+H UCFLX, SAFL2G

Over	InclL	High	Low	Max
30	50	0	-11	20
50	80	0	-13	25
80	120	0	-15	35
120	150	0	-18	40
150	180	0	-25	45
180	250	0	-30	50
250	315	0	-35	60

(Notes):

1.  $\Delta D_{mp}$ . The deviation of a single plane mean outside diameter of the outer ring.
2. Kea Radial runout of assembled bearing outer ring.

### 1.2. Inner rings tolerances

The inner rings tolerances are shown in Table 4 and Table 5.

#### 1.2.1. Tolerances fbr cylindrical bore bearing inner rings

Table 4

Cylindrical Bore Inner Rings Tolerances

>120~180	+33	0	22	+ 100	-100	0	-250	35

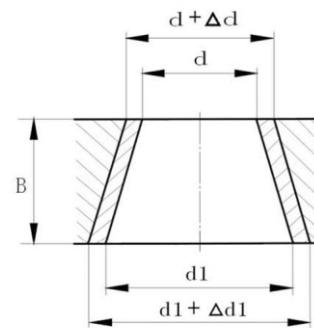

(Notes):

1.  $\Delta d_{mp}$   
Single plane mean bore diameter deviation.
2. Kia  
Radial runout of assembled bearing inner ring.
3.  $\Delta B_s$   
Deviation of a single width of inner ring.
4.  $\Delta H_s$   
The deviation, of a single eccentric volume of inner ring or eccentric locking collar.
5. Vdp  
The deviation of a single radial plane bearing bore diameter of the inner ring.

Table 5

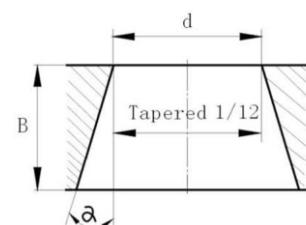

Tolerances on Inner Rings of Tapered Bore Bearings

d (mm)		$\Delta d$		$\Delta dl - \Delta d$		( $\mu m$ )
Over	In cl.	High	Low	Max.	Min.	
10	18	+27	0	+18	0	
18	30	+33	0	+21	0	
30	50	+39	0	+25	0	
50	80	+46	0	+30	0	
80	120	+54	0	+35	0	
120	180	+63	0	+40	0	

(Notes):

1. The deviation from nominal taper is defined as the limits of ( $\Delta dl - \Delta d$ ), where  $\Delta dl$  is actual deviation of  $dl$  from nominal bore diameter at larger end and  $\Delta d$  is actual deviation of  $d$  from nominal bearing bore diameter.  $dl$  is obtained by following formula:  $dl = d + 1/12 B$  Where  $B$  is width of bearing inner ring
2.  $a =$  The nominal taper angle =  $2^\circ 23' 9.4''$

## 2. Tolerances for Housings

### 2.1. Tolerances on spherical inside diameter of housing

Table 6

Tolerances on spherical Inside Diameter

( $\mu m$ )

Da (min) Nominal spherical inside diameter		H7		J7		K7	
		Dam		Dam		Dam	
Over	Incl.	High	Low	High	Low	High	Low
30	50	+ 25	0	+ 14	-11	+ 7	-18
50	80	+ 30	0	+ 18	-12	+ 9	-21
80	120	+ 35	0	+ 22	-13	+ 10	-25
120	180	+ 40	0	+ 26	-14	+ 12	-28

250	315	+ 52	0	+ 36	-16	+ 16	-36

(Notes):

1. Damax-Da maximum measured value of Da.  
Damin-Da minimum measured value of Da.
2. Dimensional tolerances for spherical inside diameter of housing are classified into H7 clearance fit, K7 for interference fit and J7 for intermediate fit between H7 and K7.
3. When H7 fit is applied, the self-contained bearings are equipped with locking-pins.

### 3. Features Of VKE Bearings

All VKE bearings available in this catalogue reflect the implementation of the company's latest engineering design skill and quality assurance policy. If you have special needs that are not found in this catalogue, please be sure to contact us. We offer assistance with applicable analysis and can customize design for your special applications.

1. With automatic self-aligning function
2. Big bearing load capacity
3. Long using life-span
4. Excellent sealing performance
5. Strong housing
6. Bearing can be locked easily on the shaft
7. Low noise, High speed

### 4. Materials

The performance and reliability of rolling bearings are greatly affected by the materials which the bearing components are made from • VKE bearing rings and balls are made of high quality of GCrl5vacuum-degassed bearing steel • Chemical composition of GCrl5 bearing steel is basically equivalent to some representative bearing steel as the chart shown show.

Table 14

Chemical composition of high-carbon chrome bearing steel

Most of ball bearing cages are made of cold rolled steel sheet. And for some bearing types and special applications, cages are made of glass fiber reinforced nylon 66 plastic .phenolic or machined brass.

The material of bearing housings is gray or ductile cast iron, housings can also be made of pressed steel, stainless steel, or engineering plastics for special purposes.

### 5.Lubrication and Operating Temperature

#### 5.1. Lubricants

The industry lithium based No. 2 lubricating grease defined in GB7324. Lithium based lubricant grease is sealed in the spherical outside surface ball bearings during manufacturing. Its physical and chemical properties are shown in table 15.

Table 15

Mechanical impurities (pc/cm3)	10-25 pm 25-75 pm 75-125 pm >125 pm	<5000 <3000 <500 0

## 5.2. Operating Temperature

The bearings usually operate below the temperature of 120 °C (the measuring temperature of the outer ring is 100°C). Grease life reduction has to be taken into account when the bearings continue to operate at a temperature above 70°C. The lowest operating temperature should not be lower than—10 °C.

## 5.3. Relubricate Period

Under normal operating condition, the grease should conform to the life of the bearings. Relubricatable type bearing units must be periodically greased to assure long life.

The greasing interval is dependent on the bearing running speed, operating temperatures and ambient conditions.

The following table shows the standard relubrication period.

Table 16

## 6. Grease Fitting

The grease fittings applied by VKE bearing units are classified as A type(straight) type B type 45° and C type(type 90°) which are made of brass or steel. Grease nipple types for VKE standard bearing units are given in table 17. The availability of the grease nipple dimensions and designation to each type is M6x1,M8x1 ,M10x1 ,1/4—28 UNF, 1/8~27NPT,GI/4 —19 and GI/8, as given in table 18. Customers are free to order with the specified dimension and designations.

## 7. Selection of Shafts

The ball bearing unit is provided with two hexagonal setscrews 120° apart on one side of the inner ring. Under normal operating conditions, the inner ring is mounted on shaft by means of a loose fit to ensure convenience of installation. In this case, the dimensional accuracy of the shaft is shown in Table 19.

When the ball bearing is used at a high speed or under a heavy load, the inner ring of the ball bearing should be mounted to the shaft by means of a tight fit. As shown in Table 20.

Some bearings can be installed to the shaft by means of adapter sleeves. In this method-, the bearing bore is made of 1:12 taper and the corresponding tapered adapter sleeve is applied. This is a convenient method that can be used as the intermediate bearing of a long shaft • In this case? the dimensional accuracy of shaft is shown in Table 21•

## 8. Mounting of Bearings on Shafts

### 8.1. Setscrews Locking Type Bearings

There are two setscrews located at two places on one side of the wide inner ring 120° apart with which the bearing can be mounted to the shaft. When mounting the bearing to the shaft, the torque shown in the following table 22 is recommended to tighten the setscrews to shaft.

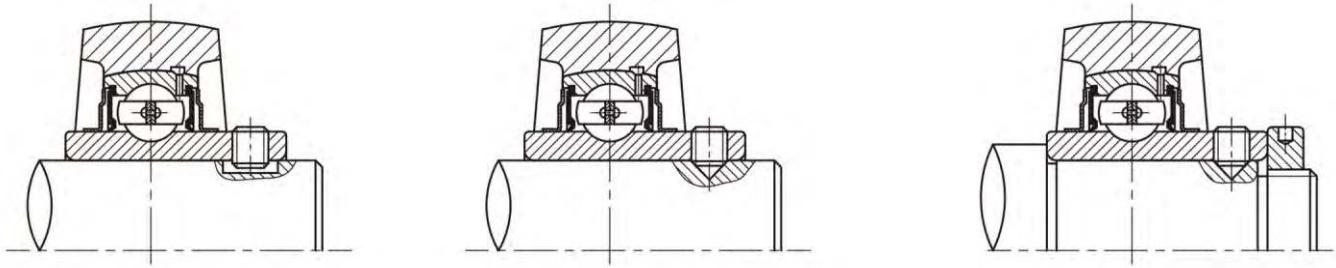

Table 22

In case of either the vibration is caused to the bearing, the alternating movement takes place» the load applied to the bearing is larger or the shaft rotation speed is rapid, it is desired to provide with the filed seat of concave section al the part where the setscrews contact with the shaft. If large thrust load is charged, it is recommended that joggling tightened with nuts be used to install the bearing most effectively to the shaft. As shown in. Fig. 1.

Fig. 1

File the shaft surface where the setscrews are positioned.

Make a concave section the shaft surface where the setscrews are positioned.

When a large thrust load is charged, it is better to use joggling tightened with nuts.

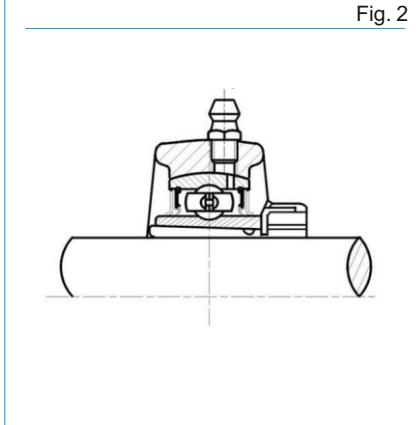

## 8.2. Adapter Sleeve Locking Type Bearings

The inner ring bore of this type bearing has a taper of 1 : 12. The sleeve is installed to an arbitrary position. After the shake proof washer is inserted the nut is tightened. The proper nut tightening condition can be obtained if it is tightened enough by hand and then rotated by 2/5 to 3/5 revolution with a spanner.

After tightening the nut, bend the shake proof washer within the slot. Otherwise the nut may loosen and creep may be caused between the shaft and sleeve.

It is necessary the nut be not tightened too hard. As shown in Fig. 2.

Fig. 2

## 8.2. Adapter Sleeve Locking Type Bearings

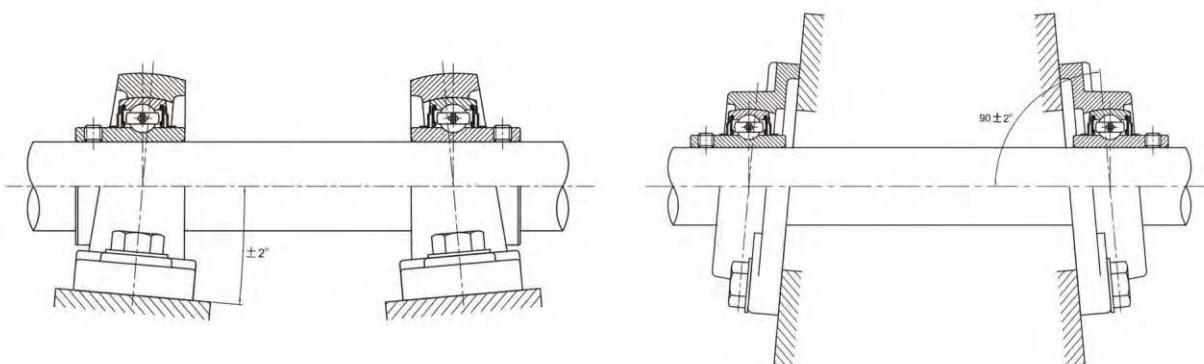

The eccentric part of the collar mates with the inner ring of the bearing which is made eccentric with the collar. When locked to the shaft by hand in direction of the shaft rotation 9 the eccentric locking collar tightens automatically to the shaft by force of working radial loads. Then, look the setscrew provided on the collar to fix the eccentric collar to the shaft. As the shaft rotation force or load is not charged on setscrew directly? it will not loosen during operation.

## 9. Mounting Method of Housings

The desired installation order is: first install the housing, then the shaft and bearing. The bearing units can be easily installed in principle at any place. However in order to have a long service life, it is desired that the mounting base is flat and rigid.

The pillow block type and flange type housings are desired that the angle between the surface on which the housing is mounted and the shaft be maintained to a tolerance of  $\pm 2^\circ$  (Fig. 3).

Fig. 3

### 9.1. Mounting Method of Take-up Units

The Take-up units are mounted on two parallel slides, bearing centers to be adjusted by adjustable bolts. The relevant parts dimensions are shown as Fig. 4.

## 10. Permissible Speed of Rotation

The permissible speed of rotation of the ball bearing units is connected with the fit between shaft and bearing. It is recommended that under normal operating conditions the fit between the bearing and the shaft be h7, the relevant values of permissible speed of rotation are shown in table 27. Close fit allowing lower speed: 5 recommended when lighter load is applied, while tighter fit allowing higher speed is recommended when heavier load is applied.
